The original software version known as MicroCAD, was delivered on a floppy diskette; starting in 1984, an initial version of the software ran on DOS-based PCs. In September 1989, a new version known as Release 3, came out. On April 18, 1994, Release 4 followed. On October 24, 1995, the third version (Release 5) of AutoCAD was introduced, followed by Release 6 on July 15, 1996. Subsequent versions of AutoCAD were released every two years, with the most recent version being 2015's Release 2016. In 1994, Autodesk re-released AutoCAD as a browser-based program. To do this, Autodesk wrote a platform-specific plug-in program that would let AutoCAD run in a web browser window. Two years later, on January 31, 1996, Autodesk released version 9, which was a major upgrade to the browser-based AutoCAD. Since version 9, Autodesk had been working on developing its own XML-based workflow, which was first demonstrated at the 2000 e-Business Conference. It was launched on August 28, 2001, as "e-Portfolio". The name was changed to "AutoCAD Workspace" in 2007. AutoCAD Workspace includes a suite of applications that were designed to work together to streamline the document preparation and approval process. In 2014, Autodesk launched its newest version of AutoCAD. On June 30, 2015, Autodesk released AutoCAD 2016, which was the last version of the venerable AutoCAD software. In 2018, Autodesk released AutoCAD Architecture, its first architectural CAD product. AutoCAD Architecture allows users to draw, view, and analyze architectural models. Autodesk AutoCAD vs. competitors AutoCAD's closest competitor is DraftSight, which was introduced in 1995, and is also a desktop CAD program. DraftSight was created by TopoSoft, the CAD division of Autodesk. TopoSoft was acquired by Autodesk in 1998, and Autodesk renamed DraftSight to Raster Design. Later that year, DraftSight was re-launched as AutoCAD. AutoCAD's closest competitor is DesignSpark Mechanical, which was introduced in 2009. It is available on Windows, Macintosh, and Linux. AutoCAD's closest competitor is VectorWorks, which was introduced in 1991. VectorWorks was

Data exchange In the past, products that were based on AutoCAD and used the DWG file format exported data to CADGAL, a data format based on XML. Starting in the 2006 release, DWG files exported to CADGAL using a new set of XML tags, called schema. This schema had some similarities with the StarOffice Open XML format. In 2013, this format changed and became more complex. In 2016, it changed again, this time with a format used by Autodesk Fusion 360 and other products, called Stand-alone interchange format (SDF). When a DWG file is exported to CADGAL, it uses a schema in addition to the AutoLISP (AutoCAD LISP) which the CAD application uses to create its DWG file. Schema AutoCAD uses the schema to keep track of AutoLISP function and variable values in the DWG file. As this schema is meant to be backward compatible with CADGAL it can't change over time, but the AutoLISP tags can be. If a DWG file uses a new version of the schema, it will fail to load in the CAD application. History AutoCAD's development process is often compared to that of a long development process for game consoles. The first, and only version of

AutoCAD (AutoCAD 1.0), was released in 1993, and was a DOS application. In the two years following the introduction of AutoCAD 1.0, AutoCAD 1.1 was released, but lacked many features. In 1995, AutoCAD 2.0 was released, which was a DOS application, with a graphics API (Windows 3.0) and a Windows GUI. In 1998, AutoCAD 3.0 was released, which was a DOS application, with an improved Windows GUI. In 1999, AutoCAD 3.5 was released. In 2000, AutoCAD 2000, AutoCAD 2000x, and AutoCAD 2002 were released, which were DOS applications, with graphical improvements and Windows 3.1 GUI improvements. The later AutoCAD 3.1 product and AutoCAD 2002, were fully rewritten for Windows XP, and by this time had the user interface of AutoCAD 2000. The Microsoft Windows 3.1 GUI was used because it allowed AutoCAD to use the newly added and still in development Windows a1d647c40b

"Perpetrators of different gender identity statuses are more likely to commit and be victims of violence, whereas victims of same-sex relationships are more likely to become perpetrators," according to the study. "The increased frequency of verbal abuse, threat of violence, and physical abuse against lesbian and gay parents in comparison to heterosexual parents suggests that same-sex parents are more susceptible to rejection, hostility, and disrespect. "Many same-sex parents also perceive the media and societal attitude toward lesbians and gay men as hostile, while heterosexual parents are more likely to experience it as neutral." There are problems with the methodology of the study and the findings, however, two prominent Australian academics note. First, the study did not find abuse was perpetrated by parents who described their relationship as "traditional" — both straight couples and same-sex couples. "While the article reports on studies in the USA, Canada and Australia, it is striking that the study failed to report on abuse in same-sex relationships, which have been reported in the USA, UK, and Ireland," said Dr David McVey, from the University of Newcastle. "This is likely to be because most studies in the area of lesbian and gay parenting use samples that are too small to
