magnetic data storage systems and, more
particularly, to a system and method for maintaining
a rotation of a motor in the event of a failure of one
of the eight transistors contained in an eight

transistor static random access memory (SRAM) cell. The primary concern with the accumulation of static charge on an integrated circuit is the damage which such accumulation causes. Although charge buildup due to normal device operation is not particularly damaging, even small amounts of charge which are not reduced due to device operation can create such problems as the possible formation of local electric fields that may enhance charge injection into the substrate. Such charge injection can create hot spots which may melt underlying layers. In addition, charged particles floating in the air above the substrate can be accelerated to the substrate by the electromagnetic fields created by the local electric fields. Such charge build up is often encountered in magnetic data storage media. To provide effective charge control, a conventional magnetic disk comprises an aluminum substrate which is coated on both sides with a thin film of a magnetic material. The thin film is divided into a plurality of concentric tracks each
