Heterogeneity and spectral changes in C-reactive protein in comparison with serum lipoproteins. C-reactive protein (CRP) and the apolipoproteins (apo) of serum lipoproteins were analyzed in twelve healthy subjects, by gel filtration, electrophoresis and immunoelectrophoresis. The CRP conformed to the typical pattern of lipoproteins. The heterogeneity of CRP, compared to the two homogeneous lipoproteins, the HDL and the LDL, was demonstrated by isoelectric focusing in agarose gels, immunoelectrophoresis and Western blotting. CRP and lipoproteins were equally sensitive to the action of acetylcholine (Ach) and this action, however, was different in CRP. CRP converted, in contrast to LDL, into the smaller forms of protein after the exposure to Ach. A correlation between CRP and lipoproteins was observed in serum after centrifugation. The results point to the heterogeneity of CRP and to a close relationship with the HDL.
