Rat gastric acid secretion can be stimulated by infusion of 10 micrograms/kg/h gastrin or 25 micrograms/kg/h secretin. The infusion of both peptides did not have any effect on the secretin-like peptide, somatostatin, which was similarly infused at concentrations of 0.1, 1, and 10 micrograms/kg/h. The gastrin infusion resulted in a significant inhibition of gastric acid secretion but the secretin infusion was without effect. When gastrin was infused at a rate of 10 micrograms/kg/h both the G cell stimulating peptide, gastrin-releasing peptide, and the G cell inhibiting peptide, bombesin, caused a significant inhibition of gastric acid secretion. Intravenous infusion of insulin (5 micrograms/kg/h) during the gastrin or secretin infusion completely blocked the inhibitory effect of gastrin and secretin on gastric acid secretion. It is proposed that insulin exerts its inhibitory effect by acting at the G cell to produce a second messenger which inhibits the gastrin receptor and/or the secretin receptor.Q: Pandas apply subtract 1 if condition met I have a data frame of column names, and the values of the column names also exist in another dataframe df1 = pd.DataFrame(data= {'Name':['aaaa', 'bbbb', 'cccc']}) df2 = pd.DataFrame(data= {'Name':['aaaa', 'zzzz', 'yyyy']}) I can easily do df1['Name'] == df2['Name'] and df1.index == df2.index to get a True or False of every match: >>> df1['Name
