So that's all for this review. I hope that you found it informative. As I stressed in the beginning, it definitely had a different feel to this review. You'll notice that I stopped trying to shoehorn in every possible feature or ability for the CC format software, even if there were things missing. If you are a Photoshop user, chances are that you know about it. If you're a Lightroom user, you know that Photoshop is becoming more of a necessity, not a luxury, based on what we've seen over the past year. It doesn't mean that I've declared war on Photoshop, but perhaps this review gave you a good idea of why there is a change happening in the way that Adobe is developing these tools as we speak. It is about quality, not quantity. Many will also be very excited about the potential of the Fuji X-T1 as a prime software, and I would not disagree - it seems to be a fantastic camera. However, the future is now. Now let me head you to the iPad version of Photoshop. Here are some of the new features you can use:

- New filters
- Text layers
- Real-time photo effects

- Incredible improvement in performance, especially when previewing large collections
- Automatically recognizes and groups similar images
- Ease of handling your photos
- Drag to edit
- Easier organization of photos into albums
- Improved selection tools
- Saving is faster, and the transition to the new file system is smoother

Are these new features compelling enough to switch from Lightroom 4 to 5? I frankly couldn't care less whether my catalogs are stored on a hard drive or a solid state drive. I'm also not particularly interested in the new features that not all of us can use, like the new Nikon S and Z (camera) features.

If you have ever opened an image in Photoshop, you have already used the image panel. In this new version, you'll find the same functionality in the new image module—you simply need to click where you want to add content to your image, and then where you want to pull content from your image. You can even choose to duplicate content.
