Jump to the comments to learn more about the differences between the two products, the functionality of the completely revamped UI, and some of the other lesser known toys waiting for you to play with. The way files are organized means it's almost impossible to find a specific layer at a time, which is a bit troubling—but by no means fatal—as my search algorithms are up to date. Use the new search feature to quickly find and open a specific flat layer dialog box that contains all of your flattened layers. There are also a few minor interface quirks like the inability to use absolute layers, the copy values tool for selecting areas of a photo, and a few other niggles. A few tools in the Underwatch toolbox have been tweaked, but none significantly. Aside from a few tweaks to the Lighting Effects tool, it looks like Photoshop CC loses nothing from its predecessor—but it gains some new features in the way of a redesigned UI, a more powerful editing experience, and a couple of new tools.

The most interesting feature that has been announced is the addition of the new world standard CC 2017 APIs, named "Native Rendering." This makes the transition much easier to the native GPU and is also the foundation for the introduction of the new modern pipeline and the 3D tools coming to Adobe Artist Cloud next year.. It's important to note, however that despite the name change, the rendering still stays on the CPU, which means that we will still have to use some kind of flip or composite in order to print some of the more complex effects. We do expect that over time we will see the native APIs codify the pipeline into more like a standard for 3D applications as it stands today. In the meanwhile, there are still a lot of tools and options you can use on CPU-based rendering to create some pretty stunning effects. We do hope to see a lot of the great free and commercial plugins coming to the native pipeline very soon too.
